

## EVAPORATIVE COOLER

### If you can't **STAND THE HEAT** - **HIRE AN EVAPORATIVE COOLER**

**At the time of going to press the great British summer has yet to materialise, but the very unpredictable nature of our weather means that people have to react extremely quickly to sudden changes in temperature when the sun does appear.**

Keeping cool when the temperature is on the up has never been easier than it is now with Brandon's range of evaporative coolers, that utilise the fastest growing form of air-cooling in the world with an ability to produce high volumes of cool, clean air in a safe economical way.

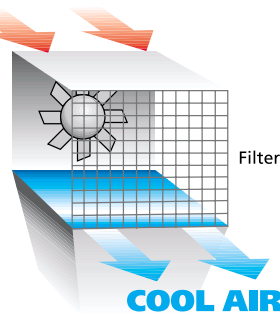

#### What is evaporative cooling?

Evaporative coolers work by a natural process of evaporation in much the same way as a sea breeze passing over the ocean. Hot air is drawn into the cooler and passed

over water held in a large, water saturated filter pad. This causes the water to evaporate absorbing the heat and produce cool fresh air without the use of C.F.C's and as the coolers do not produce aerosols, (droplets) there is no support for Legionella bacteria.

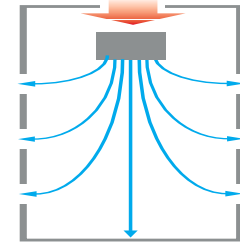

#### HOT AIR

#### BENEFITS

- No external ducting or plumbing required.
- Cleans and filters air.
- Quiet.
- Mobile.
- Energy efficient.
- Ideal for shops, offices and industry.
- Simple to set up and operate.
- Range of sizes for every situation up to 300m<sup>2</sup>.

#### WARM AIR

COOL AIR THROUGHOUT  
THE ROOM
